SpendWise AI - Smart Spending Assistant

Independent PayPal-Connected Hackathon Prototype | Executive Summary

1. NAME & SMALL DESCRIPTION

Name: SpendWise AI - Smart Spending Assistant

Small Description: An independent, PayPal-connected personal financial copilot designed to empower consumers to make disciplined, highly informed purchasing decisions. It unites deterministic monthly envelope budgeting with non-negotiable living protections, true delivered costs, PayPal Sandbox test payments, and privacy-preserving peer spending benchmarks.

2. PROBLEM YOU TRIED TO SOLVE

1. Opaque True Purchase Costs: Sticker prices routinely conceal shipping, handling, and mandatory local taxes until final checkout, causing sudden monthly budget overruns.
2. Unrealistic or Destructive Budgeting: Conventional apps either act as passive rear-view trackers or recommend naive mathematical cuts that slash non-negotiable essentials (rent/food).
3. Disconnected E-Commerce: Shopping is isolated from budgeting; users cannot immediately calculate how an active cart impact remaining category headroom before making payments.
4. Context Vacuum: Inability to benchmark personal spending against verified, privacy-safe cohorts.

3. THE BEST SOLUTION YOU HAVE COME UP WITH

* Smart Budget Plans: Deterministic baseline calculations combined with structured AI optimization that safeguards essential commitments (rent, groceries) and explicitly flags infeasible shortfalls.
* Smarter Product Search: Complete delivered cost calculation (item + shipping + tax - discounts) paired with real-time remaining budget impact and verified PayPal Sandbox checkout.
* Spending Intelligence: Peer benchmarking enforcing k>=30 privacy threshold, median spending analysis, and normalized historical period comparisons (-12.5% expense, +10.0 pp savings rate).
* Integer Minor-Unit Math: 100% integer paise/cents math eliminates IEEE-754 floating-point drift.

4. HOW YOU CREATED THE SOLUTION IN THE FORM OF APP / WEB / AI

* Web Application (Frontend): React 18, TypeScript, Vite, Tailwind CSS, Lucide icons.
  Features AG Grid Community for ledger/products, Recharts for budget/peer graphs, TanStack Query.
* Backend API & Engine: Node.js, Express, TypeScript, Zod runtime schema validation.
  Houses single-source-of-truth financial calculator service, CSV injection defense, and REST APIs.
* AI & Rules Engine: Dual-layer intelligence combining deterministic rule validation with Gemini generative narrative explanations and structured constraint-tested recommendations.
* Integrations: PayPal Sandbox test payments, Channel3 product search, Elasticsearch with DB fallback.

VERIFICATION & QUALITY AUDIT STATUS: 100% PASS RATE

All 51 automated regression tests passed across financial math, auth isolation, budgets, and PayPal.
